

CHICKEN PROCESSING

Jacketed tanks are heated with steam to cook large quantities of chicken. Good control and fast response are needed to adjust to load changes. One specific customer preferred a self-operated regulator, but had experienced poor performance with competitive units and were wary about trying another self-operated valve.

The customer decided to try a Jordan Mark 80 and found it to work flawlessly. It offers the response time (small span) and tight control the customer requires and is more commercially attractive than a control valve due to no external power source being required.
