

## WIDE PRESSURE RANGE

A pressure reducing station is 30' in the air and must control downstream pressure between 2 and 120 psi. The range changes daily, and therefore, remote control is necessary.

The Mark 66 air loaded pressure regulator with a manual loading station will give you the remote control necessary. It will also provide a wider range than is available with a self-operated regulator. The Mark 66 will provide you with the most accurate control available in a regulator. There are very few parts in the regulator, and maintenance is a snap.
